Category: Baby Gates

Subcategory: Baby Gates

Tip: How Much to Spend on a Baby Gate

How much you should spend on a baby gate really depends on how often you will use it. If you simply need to have something on hand for when company comes over with young children a few times a year, you can probably find an inexpensive pressure-mounted gate for about \$25 or less that will work. But if you need a sturdy gate that you will use on a daily basis, consider some of the more expensive, mounted baby safety gates that you can attach in your doorway. These range in price on up to \$75 or more, depending on how wide your space is, what style you pick, such as a retractable baby gate or a swinging style, and what material you select. In addition, purchasing gate extensions can sharply increase the price of your system, – usually adding anywhere from \$25 to \$40 or more for each extra panel, depending on the dimensions you need. But the benefit is that you get a custom fit for your space, along with the peace of mind that goes with it. That makes this is a wise investment.

Tip: Stairway Safety Gates

If you plan to put a baby gate at the top of a stairway, it is essential that you select one that has been approved for this usage. Young children often lean on baby gates and try to climb on them. While this is dangerous anywhere, the top of stairs poses an even greater hazard, since if the gate gave way, your child could go tumbling down with it. Therefore, it is important to plan accordingly. Stairway gates must be firmly mounted or screwed into your wall or banister, so there is no chance that it can give way. It is important to note that pressure mounted gates, which are held by exerting pressure between two walls but are not physically attached, should never be used on the top or the bottom of stairs. For further stairway safety, consider a KidCo baby gate called Gateway that allows you to set the direction the gate swings. For even more protection, select a gate that comes with an alarm. This will alert you if the gate isn't closed all of the way or if your child tampers with it.

Tip: Travel Gates

Travel baby gates can make it easy to go visiting with your baby. These portable, easy-to-stow models make safety a breeze and give you peace on mind in other people's houses or in hotels, which may not be baby proofed to your high standards. These baby safety gates are also good to have on hand at home, for times when you need an extra barrier to keep your children safely contained in one room. One KidCo baby gate, called Gateway to Go, is a reliable option made of a steel frame with a see-through mesh barrier for the body. This model folds to make travel and storage easy and convenient and comes with a handy carrying case. Another good travel choice

is an Evenflo baby gate, called Evenflo's Extra Wide and Soft Gate, which transports easily and expands with ease for wider doorways.

Tip: Where to Find Baby Gates

Baby gates are easy to find. They are sold in most discount and houseware stores, baby specialty stores and some home improvement and hardware stores. Pet stores are another good place to look, as baby safety gates can be used to keep pets contained in one room. In addition, many security companies offer customized gate options to fit your home. You can also shop online for baby gates, which makes it easy to compare models, features and price 24 hours a day, seven days a week, from the comfort of your own home. Just be careful about buying used baby gates from online auctions and second-hand stores, as some of the older models do not meet today's safety standards, and some have been recalled.

Category: Bathroom Safety

Subcategory: Bathroom Safety

Tip: Baby Tub

Your bathtub may be just the right size for you, but for a baby, it could feel too large and overwhelming. It can also be hard to keep a small baby, who doesn't have full muscle control yet, from slipping in your tub. That's why many parents purchase infant or baby tubs, which are an important children's safety product. Some models can be used either right inside your bathtub, or as a stand-alone option. Other infant tubs can even rest right across the top of your tub, so you don't have to stoop to bathe your baby. Infant bathtubs usually have a reclined seat that props your baby up to make it easy for you to clean him or her. Whatever tub you select, however, never leave your child unattended. This is a bathtub safety must.

Tip: Bath Seat

To make bath time safe and enjoyable for your little one, try using a bath seat. This child safety product is an option for babies who are too big for their infant tub. In order to use a bath seat, your baby has to have enough control to sit up alone. The bath seat provides a secure way to keep your baby in the sitting position. However, while bath seats give your baby added support, keep in mind that they are no substitute for adult supervision. Therefore, always keep your baby within arm's reach and be on the lookout for tipping to ensure bathtub safety. Be sure to avoid older bath seat models that attach with suction cups and have larger leg holes, which could be hazardous for your baby. The newer models have more safety features, including a T-bar that goes between the baby's leg, and they attach with an arm that fits over the side of the tub (these don't

work on sunken tubs, though). Always be sure that the clamp fits the thickness of your tub for safety. Be sure to follow the manufacturer's installation directions completely and test the product for safety yourself. Look for models that seem well made and have no sharp edges and look like the right size for your baby. You might also opt for a style that comes with bath toys attached, to entertain your child while bathing. Regularly check child safety product recall lists to make sure the model you select has not been recalled. Bath seats have been controversial since they do pose some risks, but when used correctly and carefully, they can be a step in your bathroom safety routine.

Tip: Bath Thermometer

How hot is your baby's bathtub water? Bath thermometers take the guesswork out of answering this question. Since young children are very sensitive to temperatures, it is essential that the water not be too warm for them. Some children's bath thermometers are contained in cute plastic shapes such as ducks or boats, allowing this essential children's safety product to also do double duty as a favorite bath toy. Usually these thermometers work by floating on the surface of the tub for 20 to 30 seconds before giving a reading. If the water is in the safe range, which is between 36 to 38 degrees Celsius, a black temperature strip on the bottom of the toy should turn color. If the strip remains dark, however, the water temperature is too hot or too cold. While children's bath thermometers are a necessity for houses with babies and young children, when it comes to bathtub safety, don't rely on this method alone without also using your own judgment. Always also stick your hand in the tub to confirm that the water feels right to your touch before allowing your child to get in. You can also look for baby bathtubs that have a temperature strip built right in.

Tip: Disposable Toilet Seat Covers

Bathroom safety shouldn't stop when you leave home. In fact, public restrooms can be full of germs and other hazards. But with disposable toilet seat covers, you can arm your children with an important bathroom safety product that will help keep them clean and germ-free. For convenience, stick a few travel toilet seat covers in your bag and take them out when your child needs to use a bathroom outside of your house. Most of these covers stay in place with an adhesive and cover the seat of the toilet, which could be dirty or wet. In this way, there is an important barrier to keep your child's skin from touching the offending area. When your child is through, simply unstick the cover and throw it away.

Tip: Doorknob Cover

For just a few dollars, you can kick your bathroom safety regime up a notch by installing doorknob covers. This children's safety product is a plastic mold that goes over your doorknob and makes it difficult for most toddlers' little hands to open it. This can be an important way to keep your children from entering the bathroom without your

supervision. You can also use a doorknob cover on your bathroom closet to restrict access to cleaning products, prescription and over-the-counter medications and other potentially dangerous substances. There are different door knob cover brands and styles available, so be sure to select one that fits your doors and is sturdy enough not to break. Also make sure all of the adults in your home can easily open the knob themselves in case of an emergency.

Tip: Step Stool

Step stools are great children's bathroom safety products that make it easy for young children to be more independent. Select from one of the many stool styles available so your child can reach to brush his or her own teeth, step up to the potty or reach for a towel without help. Children's step stools come in a variety of materials, including plastic and wood, and the array of designs spans a wide range-- from animals to cartoon characters and shapes – so there is sure to be one that appeals to your child's interests. For toddlers and pre-schoolers, be sure to pick a style that is low to the ground, so it will be easy for them to access safely. If space is limited in your bathroom, look for a stool that has a drawer underneath or folds up. By using this product, your child won't have to stretch to reach things and your bathroom will be safer as a result.

Tip: Window Wedge

If your child likes to climb and explore, the windows in your bathroom could pose a hazard. That's why a window wedge is an essential children's safety product you can't do without. A window wedge uses adhesive to stick to your window and hold it at the height you desire. Your child won't be able to slide it further, which will prevent him or her from falling out or climbing out. In addition, the wedge is an important bathroom safety product that helps keep the window from closing on little fingers. You can use the wedges on either double hung or sliding windows, and they work with either vertical or horizontal openings. The best part is that when you are done using the wedge, simply peel it off and your paint will be unharmed.

Category: Cabinet Latches

Subcategory: Cabinet Latches

Tip: Appliance Latch

Not only cabinets are dangerous for young children. Appliances also need latches to keep your kids safe. Select a heavy-duty cabinet latch for your refrigerator, microwave, washing machine, drier, stereo and file cabinets. Some appliance cabinet safety latch designs attach to the sides or tops of appliances using a special adhesive that is strong enough to prevent your child from opening.

Subcategory: Cabinet Safety Latches

Tip: Installing Cabinet Latches

Proper installation of cabinet latch ensures its effectiveness. Take a few extra moments to measure out the space where the latch base and latch will be mounted. Usually, this measures about half-an-inch to an inch from the edge of the cabinet. When the cabinet is opened, the latch should prevent the cabinet door from moving past 1.5 inches.

Tip: What To Hide From Your Child's Reach

Several products and household items should be protected from children. Keep chemicals, medicines, adult toiletries (razors, mouthwash, etc.), and other potentially hazardous items in specific cabinets. Install a cabinet door latch on each of these cabinets. * Here's a secret: you can even place cabinet door latches on drawers you simply don't want opened, even if they don't hold dangerous items!

Category: Child Alarms

Subcategory: Child Alarms

Tip: Back-Up Sensor

Does backing up your car while your kids are playing nearby make you nervous? Then try a back-up sensor to minimize the risks. The child safety alarm sounds if there is anything within a few feet behind you, and the closer you get to the object, the louder the alarm will be. A typical system, which is powered by your car's battery, consists of two parts: a sensor that attaches to your rear license plate and a digital display to mount on your dashboard to tell you how close the object is behind you. With a back-up sensor child alarm to guide you, driving will be a lot less stressful.

Tip: Child Guard Transmitter

To help keep active young children close at hand when you are out in public, consider selecting a child alarm that is housed in a cute plastic animal case. One transmitter style hangs around the child's neck, while another straps on the wrist. This makes them easy to wear and fun for the child. Like other similar child locator alarms and child safety alarms, you can set it so that the alarm will go off if your child moves outside of your specified range. Better yet, if any other children in the vicinity have the same alarm, yours will reset so that your child's transmitter will work only with your receiver. Rely on this product inside or out, and always know where your child is, even if he or she tries to wander off in a crowded place.

Tip: Child Presence Sensor

A brand new type of child safety alarm, which is not yet available in stores, is a child presence sensor for cars. After the engine has been turned off for one minute, if the sensor indicates that the child remains in the carseat, the alarm will beep to remind parents. This is a good alert system for people who run to drop something off and leave their sleeping toddler in the car for a few minutes and lose track of time. It can also be a true lifesaver if you are in a hurry and you leave the car without remembering to take your child with you. This child alarm will work in all types of cars and should be out in stores sometime soon. It will sell for about \$25.

Tip: Talking School Bus

Some of the dangers that school buses pose to kids can easily be eliminated with the help of new product called the Child Safety Alarm System. This child safety alarm, which enables buses to “talk,” can be used by school buses to alert children to the possible danger of a moving bus. There are three programmable messages that can be set to let children know to stay out of the way until the bus stops, to enter or exit safely and to stand back from a bus that is about to pull away from the curb. The messages are broadcast clearly and are available in several languages.

Subcategory: Child Locator Alarms

Tip: Losing Your Child: An Alarming Thought

There is perhaps nothing as frightening as thinking your child is lost. Worries can be alleviated by using a child alarm. A transmitter is placed on your child, which will trigger your receiver to beep. This way you will know when your child has begun to wander away. Some child alarms can be adjustable to up to adjustable up to 200 feet or more. Your child's transmitter can be attached by buckle to his/her clothing. Most child alarms are suitable for indoor and outdoor use.

Tip: The Many Uses of Child Alarms

There are many different ways your child safety alarm can benefit you and your child. * In day-to-day errands, such as shopping, you can easily locate your child at any time when s/he is wearing a transmitter. * In playgrounds or outdoors, your child can alert you if s/he is injured. * Any time your child is in danger, in fact, whether it is from hurting him-/herself to a threat from a stranger, you can be alerted by your child. * Even you can use the alarms when you are away from home, in case you encounter a threatening situation!

Category: Consumer Product Safety Commission

Subcategory: Child Safety Products

Tip: Basic Home Safety Tips

Here are just a few basic home safety products and guidelines that will help protect your family. Use child-resistant packaging for medicines and hazardous household chemicals. Make sure your hairdryer has a large rectangular plug. The immersion protection device prevents electrocution if the hairdryer is dropped in water. Change the battery in your smoke and carbon monoxide alarms when you change your clock's setting in October. Babies on adult beds risk suffocation from hidden hazards such as entrapment between the bed and wall; entrapment involving the bed frame, headboard and footboard; or soft bedding such as pillows or thick quilts and comforters. It's best to have them sleep in a crib that passes safety guidelines.

Tip: Get Active In Safety

Have you experienced an unsafe product or service? You can report these to the U.S. Consumer Product Safety Commission. Consumers, Fire and police investigators as well as physicians and health care professionals can alert the CPSC to an injury, death, or unsafe product by filing a report on the CPSC website. Manufacturers, importers, distributors, and retailers can also inform of a potentially defective or hazardous product. We all have the responsibility to chip in toward a safer life for everyone.

Tip: Recalls and Product Safety News

Keep up to date on the latest product recalls. The U.S. Consumer Product Safety Commission provides information on over 4,000 product recalls and recall alerts. You can search by product type, company, or product description. Categories include children's products, household items, outdoor products, and more. Reports are updated monthly. Archives of past recalls reach as far back as 1973.

Category: Door Safety

Subcategory: Door Latch Safety

Tip: Door Safety Basics

Childproofing doors is a basic in child safety. Plenty of products on the market cater to keeping children from entering rooms where they could get into trouble. These products, made with simplicity in mind, are generally easy to install, with minimal tools required. Door jambs, locks, knob covers, and more are available to cover all your household

needs. Many of these door safety items can be used outdoors as well, increasing the level of safety all around your home.

Tip: Maintenance on Your Door Locks

Protecting your child from dangerous areas in and around the house does not stop with purchasing a door lock. Safety can only be maintained when those locks are routinely checked and serviced. Especially with prolonged use, door locks can loosen. Every month or so, check to see if screws need tightening. Every six months or so, consider replacing the units entirely.

Tip: Temporary Driveway Barriers

There are many different barriers and temporary fences for driveways available. You can find most at any baby supply store, and all online. A quick search of what you are looking for on your favorite search engine will yield you many results, and you can shop around for a price you are comfortable with.

Tip: Try A Bar Latch For An Easy Door Locking System

One of the most simple door safety products on the market is a basic bar latch. Bar latches can be placed on most household doors, cabinet doors, and shutters. These are usually installed by screwing one end of the latch to one side of the door, and the other to the door frame or matching door. The bar flips across, securely locking the door in place.

Category: Fireplace Safety

Subcategory: Fireplace Safety

Tip: How to Attach a Hearth Guard

If you have a brick or stone hearth around your fireplace, you may be worried about how you can attach a fireplace hearth guard to the area to protect your child from getting injured. Today, there are several options to cover the hearth guard as part of your fireplace safety efforts. You can select a hearth guard style that clamps on to your existing hearth, or you could opt for a design that sticks on using an adhesive. Some brands also make one that attaches by Velcro instead. For extra security, shop around for a hearthguard that allows you to purchase extra padding. In addition to hearth guards, fireplace surface protectors, bumpers and cushions all serve a similar function. The good thing about all of these products is that they are all easy to install and they won't harm your fireplace surface and can be removed when your children are older. If you don't plan to light your fire when your children are in the room and you just need to

protect your child from getting hurt on the sharp edges of the fireplace, hearth guards can be a feasible alternative to using a fireplace hearth gate to keep your children safe.

Tip: Other Fireplace Safety Tips

When you light a fire in your fireplace, a large amount of air is needed to keep the fire going. Yet many houses today are tightly sealed with weather stripping on the doors, caulk on the windows and self-closing vents, so air is at a minimum. This causes a risk in two ways. First, there is the danger that your fireplace could create a reverse draft, which would redirect carbon monoxide fumes from your furnace or water heater into your living room. Second, the amount of oxygen that the fireplace uses could leave a deficit for you and your family. To counteract these two problems, there are some important fireplace safety tips you should follow on a regular basis:

- Always open a window when you light a fire.
- Consider installing an outside air vent.
- Make sure that exhaust fans in your kitchen and bathroom are off.
- If you have forced air heat, close the vents.

These important steps, in addition to using other fireplace safety products such as a hearth gate and hearth guards, will go a long way to keep your family safe and allow you to enjoy your fireplace.

Subcategory: Hearth Gates

Tip: Adjusting Your Hearth Gate To Suit Your Needs

What if the hearth gate you purchased is not large enough to adequately surround your fireplace? Most gate companies like KidCo's have created additional HearthGate extensions. These are sold separately. The extensions easily interlock with the original gate panels, increasing your gate's length in by 24 inches at a time. Like the gates themselves, they can adjust in 10 degree increments or they can be set in a straight line, to suit your specific needs.

Category: Garage Safety

Subcategory: Garage Safety Products

Tip: Be Tool Smart

Designate specific places for tools and hang them out of reach. This will also prompt return of the tool to its proper place or let you see what may have been "borrowed". Disconnect power tools when not in use.

Tip: Garages and Fire Prevention

Many toxic chemicals are found in the average home garage. In order to protect your

children, consider taking preventative measures to avoid catastrophe. Something as simple as installing a fire detector is a step toward proper garage safety. Carbon monoxide detectors are also a good investment, as that gas is quite common in a car garage. Depending on the size of your garage, you should have at least one fire extinguisher as well. A good rule of thumb is to have one fire extinguisher per car in your garage. And don't forget to get them routinely checked!

Tip: Keep a tidy garage

Inspect your garage and determine what you really want or need to save. Dispose of old paints. They are probably past recommended shelf life anyway. The four different kinds of ant killer you tried last year? Make it a point to buy just what you will need for the present project at hand. The savings for quantity is usually not worth buying a special lock cabinet to store it in safely. For those items you must keep, do invest in some type of locking storage cabinet or put these products on a high secure shelf that your youngster cannot climb up to.

Tip: Toxic Waste Site

These areas are difficult to make safe even for older children and should be kept strictly off limits to the toddler. With the tendency towards imitation at this age, a garage or workshop can be dangerous to your toddler when combined with his natural curiosity. Garages typically contain lawn/insect poisons (meant to kill), a variety of sharp hand tools, power tools, etc. There is paint left over from your last project with the lid half on maybe, gasoline for your lawn equipment, 220 volt electrical outlets, power tools, paint remover; in other words, usually just about anything you would not want stored inside your home.

Category: Gun Safety

Subcategory: Gun Safety

Tip: Get a Free Lock

Who says you can't get something for free? When it comes to gun safety, some local police departments and gun safety groups feel that using gun locks are so important that they are giving them away to residents who need them. Most gun-lock distribution programs give away the cable lock styles. To find a free gun safety equipment program in your area, call your local police department. You can also find a free gun-lock effort locally through Project ChildSafe, which is a national effort that runs free gun-lock efforts throughout the country.

Tip: Get Involved

If you want to get involved in local gun safety efforts, there are many ways you can make a difference. For instance, help spread the word to other parents about the dangers guns pose and the importance of using gun locks and other gun safety equipment. You can also find out more about local and national groups that are fighting gun violence and volunteer to help them. Donate time and money to groups that are working to make communities safer. To learn more about national gun safety coalitions and ways you can get involved, visit Stop Handgun Violence, PAX or Project Safe Neighborhoods. You can also do a keyword search online or contact your local police department or governor's office and ask them if they know of any local initiatives.

Tip: Store Gun Cleaning Supplies Safely

Not only your guns should be safely locked away. When it comes to child gun safety, you should also store your gun cleaning supplies so that your young children can't access them. Since most of these supplies are poisonous, consider putting them with other dangerous household supplies in a locked cabinet. Or, if you prefer, place them in a locked box or safe with the gun itself. The important thing is to be sure they are located where there is no possibility that your children can get into them. By taking this important gun safety step in your childproofing routine, you can further help to keep your kids healthy and safe.

Category: Kitchen Safety

Subcategory: Food Safety Tips

Tip: Leftovers

If you have a lot of leftovers, divide portions into small shallow containers for quick and safe cooling in the refrigerator. Keep meats and their stuffing in separate containers. When reheating leftovers, kill the bacteria that have been growing by heating thoroughly to 165 degrees Fahrenheit. Bring sauces, soups, and gravy to a boil.

Subcategory: Home Safety Tips in the Kitchen

Tip: Keep Kids Out of the Fridge!

Kids love to open and close doors. Use a secure press-lock on your refrigerator to keep the door closed to curious tots. Its sturdy design ensures that it will stay effective after repeated opening and closing by adults. Its also very easy to install. Refrigerator latches accommodate top-and-bottom as well as side-by-side refrigerator models. Keep in mind that two latches are required for side-by-side models.

Tip: Stove Top Guards: Simply Effective

Keep a stove top guard on your range. This will prevent your child from reaching pots, pan, and hot burners. Made of sturdy plastic, the stove top shield mounts easily. It's always a good idea to get into the habit of turning pot and pan handles toward the back of the stove. Whenever possible, use only the back burners. The stove top shield is great additional protection to help prevent accidental scalding.

Subcategory: Kitchen Safety

Tip: Baking Soda

Did you ever have a pan fire happen when you were cooking? If so, you know how scary & dangerous that can be. Therefore, take the risk out of using your stovetop by having baby soda on hand at all times. While this substance is usually used for baking, it can also double as a fire extinguisher if needed. Here are some home safety tips in the kitchen on how to use the baking soda if a small cooking fire occurs: First turn off the gas or electricity right away, then sprinkle handfuls of the baking soda at the base of the flames. As soon as you have it under control, call your local fire department for help, just in case the flames re-ignite. Also, a few more things you should remember when it comes to safety in the kitchen is never use baking soda on deep fat fryers, since this could cause splattering. Also never use water on an electrical fire.

Tip: Fire Extinguisher

You should be sure to have a fire extinguisher located centrally in your kitchen within easy reach should a grease fire occur. It is important that you don't keep the extinguisher right next to the stove, since you could be burned if a fire occurred and you had to lean over to access it. Yet select a spot for it that is in plain sight and won't be hard to get in seconds. Most home safety tips in the kitchen suggest mounting it by the kitchen door. Also, never rely on one fire extinguisher for many rooms. Have several handy in various locations throughout your house so you can respond right away in a firer emergency.

Category: Outlet Covers

Subcategory: Outlet Covers

Tip: Outlet Plugs

Outlet plugs are a feasible option for outlets that are unused. You simply stick these plastic items to safety block access to the empty outlet. This prevents children from

being able to touch the outlet or stick things in the holes. The plus to this safety outlet cover product is that it is easy to install, and can be used with both standard and designer style outlets. The drawback, though, is that many children figure out how to remove the plugs, so if you use this product instead of a regular electrical outlet cover, you need to be aware that this danger exists.

Tip: Plugging Into Holiday Safety

The holidays are a beautiful time of year, with lots of sparkling lights and decorations. But using all of the electrical items can also put you and your family at risk for some dangers. Here are some things to keep in mind, in addition to using safety outlet covers, before you plug in the next decoration:

- Closely examine all of your lights and electrical decorations for frayed wires, bare spots, breaks, missing bulbs or other signs of excessive wear that can signal a potential danger.
- Use only UL-approved lighting on your Christmas tree and your bushes.
- Take care not to overload your outlets with more than they can handle.
- Connect your holiday strings of lights to an extension cord before you plug them into the outlet for safety.
- Never leave your holiday lights on when you go to bed or leave your home.
- If you removed outlet plugs from your outlet covers in order to use your decorations, be sure to replace these safety features after the holiday is over.

Category: Pool Safety

Subcategory: Pool Safety

Tip: Taking Care of Lifejackets

Taking proper care of your lifejackets ensures that they will last longer, and work better. After using your lifejackets, always wipe them dry, or hang to dry to prevent mold. If they have already gotten moldy, wipe with a solution of half bleach, and half water until clean. Then wipe dry and hang up. Before each use, check your lifejacket for any rips, tears, holes, or loose buckles. Never use a lifejacket of questionable quality.

Subcategory: Swimming Pool Fences

Tip: Pool Safety Is A Must, But It's Flexible!

Keeping your children safe at the pool is a necessity. Many products on the market today keep your particular needs in mind, however. Removable pool fences are designed specifically to provide a barrier around residential swimming pools for toddlers and young children. Typically a removable pool fence is available in a 42-, 48-, or 60-inch height. Pools fences are conveniently installed in sections to provide convenience for easy removal and reinstallation by parents.

Tip: The Best Height For Swimming Pool Fences

The height of swimming pool fences can range from 3.5 feet to 5 feet high. An average child capable of climbing a 4 foot high fence will most likely also be able to go over 5 feet. Beginning with a four-foot fence is probably a wise choice. Once the youngest child is older -- say around six, and hopefully has been enrolled in swimming lessons -- a shorter height like 3.5 feet is acceptable. At this point, the swimming pool fence serves more in the capacity of accident prevention (i.e., someone falling in by mistake) than as a barrier.

Category: Travel With Your Kid

Subcategory: Family Travel

Tip: Travel Fun in the Sun

If you plan to any place where there is water -- a pool, ocean, adventure park, etc. be sure you never leave your child unattended. All kids should wear a life jacket, even if they know how to swim. Especially in natural bodies of water like the ocean, find out ahead of time what is in the water. Jellyfish, pollutants, and other unfortunate things can put a damper on good times! Always bring a hat with a wide brim and sunscreen of at least 30 SPF to shield children's skin from the sun's harmful rays, avoiding sun poisoning.

Tip: Who's That Kid?

Whenever you travel out of town with your children, Make sure they have identification on them. There's no need to carry valuable passports around, however. Simply write on an index card each child's name, your name, hotel address and phone number, as well as the phone number of a close friend or relative back home. If you are traveling with a cell phone, that number should appear first. Always have a recent, clear photo of your child with you. If you do get separated, the authorities will want an up-to-date picture.

Category: Tub Safety

Subcategory: Bathtub Safety

Tip: Basic Safety For The Tub

Along with purchasing standard bath tub safety products, use common sense at baby's bath time. Keep electrical devices like hair dryers, curling irons, and electric razors well

away from the tub. Also, make sure that if there are any outlets near the tub that they are the type that meet safety standards to protect them from water. Something as simple as a slippery floor can cause a great deal of damage! Be sure to use (and teach your child to use) extra caution.
